

## POS Receipt Printer Sharing

19/07/2007

To setup POS Docket Printer Sharing:

### **On the Server (Machine the Printer is connected to)**

- Install Printer Driver – this may be the correct driver or just use the Generic Text Only Driver.
- Share this printer on the network with a simple name (eg Docket)

If this machine is going to print receipts from POS then select POS Defaults and select the port the printer is connected to as normal.

### **On the Remote Machine(s)**

- Issue a NET USE command to capture the LPT port. (Use LPT even if the printer is a COM port printer on the Server)
  - Open a command prompt and type NET USE LPT1 [\\MACHINENAME\PRINTERNAME](#) /PERSISTENT:YES
- Under POS Defaults select the port which the printer is connected as the LPT1 port as selected above.
